Course Code: ECP 281

TOPIC: BETWEEN THE BRAIN OF A NINE YEARS OLD CHILD AND A COMPUTER...

- WHICH IS MORE INTELLIGENT
- WHICH IS MORE POWERFUL
- WHICH OF THEM HAS MORE SPEED

CONTRIBUTIONS FROM MY CLASSMATES

A lot of contributions were made stating that the computer is more intelligent than the 9 year old child reasons are that computers today make use of A.I (Artificial Intelligence) and so have the ability to perform complex task that a 9 year old cannot do.

A contradicting argument was also made when someone asked “ A wise man and someone that comes to seek wisdom from a wisdom from a wise man who is wiser” In relation to the topic, this person believes that if humans manufactured the computers and made the programs that runs the computers, then these computers cannot be more intelligent than the humans.

Another person gave an analogy that supported the claim that the 9 year old child Is smarter, he added that a 9 year old child can think rationally and solve diverse problems on her own meanwhile a computer can only solve problems on the ability that it has been previously programmed to do.

A contributor also made a claim that a 9 year old child can be more intelligent that the computer if the 9 year old is set on a particular course of problem solving and not diversified, else the computer may seem more intelligent

MY CONCLUSION

I believe the computer is more intelligent because I don't think any advance society today will build a computer that can self-learn, if it can self learn then it can be able to reason and make decisions for it self too just like humans and it can adjust and adapt to whatever age as long as it keeps learning like humans do.

I also believe this claim because humans basically learn and unlearn and will be unable to keep things in memory for long, the retentive memory of humans is poorer compared to a computer , though humans programmed the computer, they will still need to revisit this same computer to solve their problems for them just because they can't or it will take them forever to do. Computers keeps things in memory for as long as forever except they are erased, so therefore the computers are more intelligent than a 9 year old child.
